### Waterproof roof coatings – in new construction

Daclar™ is ideally suited for waterproofing many different types of roof structures and is often used to waterproof new structures. Daclar's™ combination of excellent adhesion and elasticity enables it to be applied to surfaces have complex geometry and a wide range of roof substrates.

A two-component spray applied system, Daclar™ that sets instantly and fully cures within 72 hours. Once sprayed the contractor can move on. This ease of application means contractors need less time to complete the job compared to other conventional roof waterproofing products.

Daclar™ is an elastomeric asphalt emulsion that adheres to most all common roofing materials.

Contractors using Liquid Rubber's application techniques and equipment achieve greater productivity than is possible with competing systems. Typically a two-man crew will be able to waterproof 10,000 sq. ft. of roof in a single shift, including clean-up.

Roof assemblies incorporating Daclar™ waterproofing membranes have UL Class A fire ratings. Our technical service center is available to contractors to assist them with performance needs.

The research that went into these coatings resulted in a unique product with both excellent adhesion to a wide range of substrates, UV resistance and product elasticity, even at low temperatures.

Daclar™ can be applied as part of a two component membrane top coat or used alone as a waterproofing adhesive.
