Liquid Rubber

Innovators in environmentally safe protective coatings

Waterproof roof coatings – seamless, instant setting, spray applied

Daclar™ is ideally suited for waterproofing many different types of roof structures and can be used in a restorative and repair capacity or to waterproof a new structure. Daclar's™ combination of excellent adhesion and elasticity enables it to be applied to surfaces have complex geometry or surfaces that are irregular or cracking. Daclar™ flows into even the smallest cracks and fissures providing a seamless membrane that resists water penetration.

Daclar™ is a two-component spray applied system that sets rapidly and cures within 24 hours

Daclar™ is an elastomeric asphalt emulsion that is applied using a specially designed pump delivery system. Liquid Rubber provides technical training to contractors to ensure error-free application.

Contractors using Liquid Rubber's application techniques and equipment achieve greater productivity than is possible with competing systems. Typically a two-man crew will be able to waterproof 10,000 sq. ft. of roof in a single shift, including clean-up.

Prior to spray coating, Liquid Rubber recommends that all cracks, fasteners, and joints be sealed using a special High Build rubber modified sealant. This combination ensures a tight waterproof system.

The research that went into these coatings resulted in a unique product with both excellent adhesion to a wide range of substrates, UV resistance and product elasticity, even at low temperatures.

All the equipment a contractor needs to apply Daclar™ fits into a small trailer. Contractors find it easy to get to and start a job.
